

US 000287

**IN THE CLAIMS:**

1. (Currently Amended): A method for automatically framing and tracking an object of interest using a video camera associated with integrated into a hand-held processing device, such as PDAs, mobile telephones, palmtops, and portable computers to insure stability of the image content as a user manipulates the device, the method comprising the steps of:

continuously detecting relative movement between the hand-held device and the object of interest within a displayed image generated by said camera; and

continuously adjusting at least one setting of the camera in response to the detected relative movement, so as to maintain a desired framing and tracking of the object of interest within an image and/or successive images generated by the camera for selectively providing either one of a still picture of the object or video image of the object, respectively.

2. (Original): The method of claim 1 wherein the camera is integrated into the hand-held device.

3. (Original): The method of claim 1 wherein the camera is part of a module insertable into the hand-held device.

4. (Original): The method of claim 1 wherein the camera comprises a physically adjustable camera.

5. (Original): The method of claim 1 wherein the camera comprises an electronically adjustable camera.

6. (Original): The method of claim 1 wherein the camera has one or more of an adjustable pan setting, an adjustable tilt setting, and an adjustable zoom setting.

US 000287

7. (Original): The method of claim 1 wherein the hand-held device comprises a mobile telephone.

8. (Original): The method of claim 1 wherein the hand-held device comprises a  
5 personal digital assistant (PDA).

9. (Original): The method of claim 1 wherein the hand-held device comprises a portable computer.

10. (Original): The method of claim 1 wherein the camera setting is adjusted  
10 based at least in part on an output of an orientation determination device integrated into or otherwise associated with the hand-held device.

11. (Original): The method of claim 10 wherein the orientation determination  
15 device comprises one or more gyroscopes integrated into the hand-held device.

12. (Original): The method of claim 1 wherein the camera setting is adjusted  
based at least in part on an output of an image processing operation applied to an image generated by the camera.  
20

13. (Original): The method of claim 1 wherein the camera setting is adjusted  
based at least in part on a hybrid combination of an orientation determination operation and an image processing operation.

25 14. (Currently Amended): An apparatus for automatically framing and tracking an object of interest, the apparatus comprising:

a hand-held processing device including PDA's, mobile telephones, palmtops, and portable computers, having at least one video camera associated therewith, integrated therein, the hand-held device further comprising a processor  
30 operative to continuously monitor the detection of relative movement between the hand-held device and the object of interest, said processor being responsive to the detected

US 000287

relative movement for adjusting at least one setting of the camera so as to continuously maintain a desired framing of the object of interest within an image generated by the camera as a user manipulates the device.

- 5           15. (Currently Amended): An article of manufacture comprising a storage medium for storing one or more programs for tracking an object of interest using at least one video camera associated with integrated into a hand-held processing device, including PDA's, mobile telephones, palmtops, and portable computers, wherein the one or more programs when executed by a processor implement the steps of:

10                 detecting relative movement between the hand-held device and the object of interest; and

                  adjusting at least one setting of the camera, in response to the detected relative movement, so as to maintain a desired framing of the object of interest within an image generated by the camera.
